

DoubleXpresso is a simple command, which lets you duplicate selected Xpresso Nodes, but unlike the built-in click and drag functionality, it will maintain incoming connections. **ALT+Click** will keep output ports connected as well. This is especially useful, when duplicating connected groups of nodes. Outgoing connections to unselected nodes will not be maintained in order not to delete their input connections. (See examples below.)

Depending on your selection and the setup of the nodes, the command might produce the same results as the built-in function.

Installation: Put the folder "DoubleXpresso" in "Cinema4D\plugins\
Open the Command Manager (**SHIFT+F12**) and type "doublexpresso" to find the plugin, integrate it into your layout and/or assign shortcuts.

Important: The Xpresso Tag containing the nodes to be duplicated has to be selected.

In order to use the plugin properly with shortcuts, two shortcuts have to be assigned. If you choose the ";"-key, for example, make sure to assign both ";" and "ALT+;".

Examples for ALT+Click

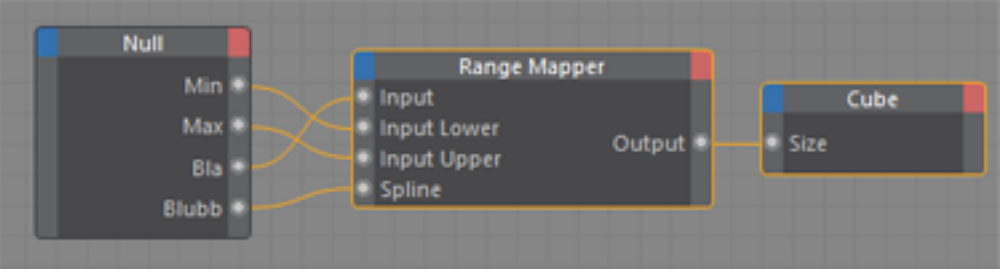

Selection: All Nodes

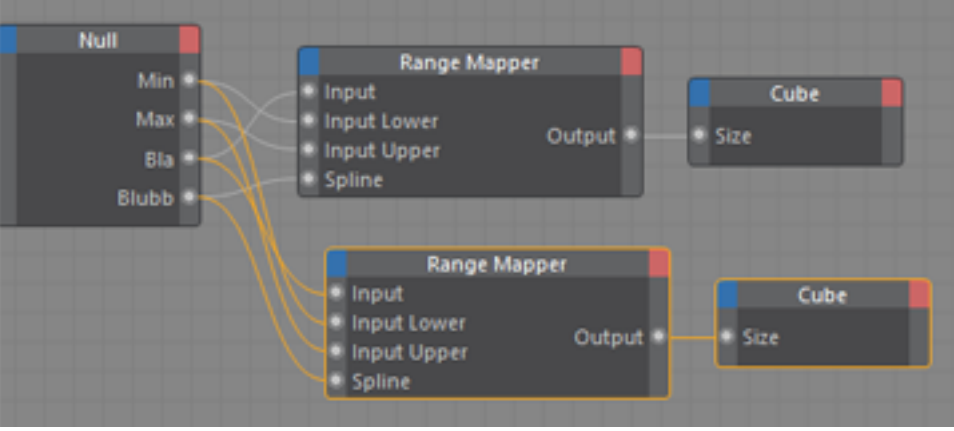

Result: Same as standard Click and Drag

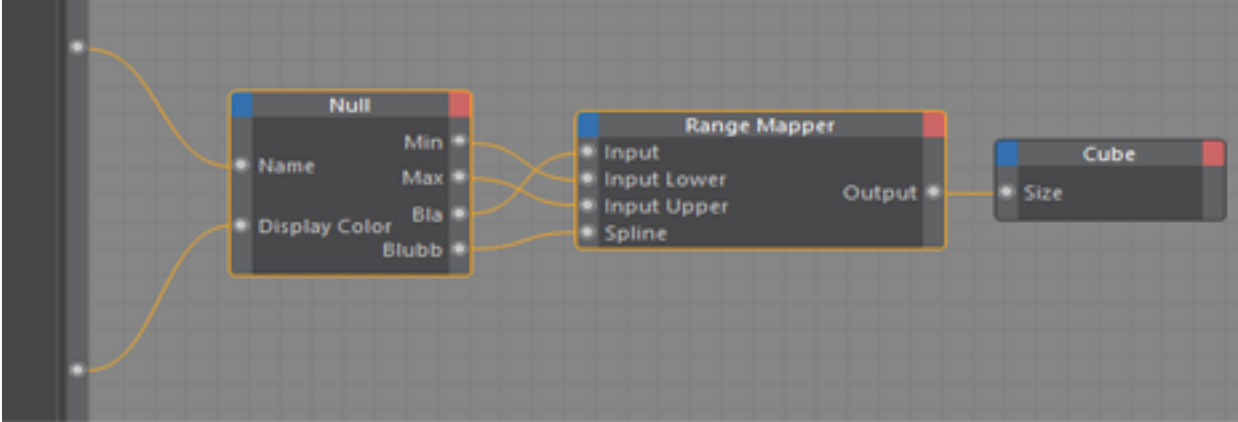

Selection:

Result: Inputs and Outputs maintained

Selection: Group with incoming and outgoing connections

Result: Inputs maintained, outputs of Null maintained but Range Mapper-Output not connected, since the Cube Node would lose its original input connection.
